A researcher is studying the sleep patterns of a group of individuals who work *night shifts*. The researcher notices that these individuals tend to have difficulty falling asleep during the day and experience fatigue during their work hours. What could be the primary factor contributing to this phenomenon …?
Positive Document
A circadian rhythm (/sərˈkeɪdiən/), or circadian cycle, is a natural oscillation that repeats roughly every 24 hours … Circadian rhythms are regulated by a circadian clock whose primary function is to rhythmically co-ordinate biological processes so they occur at the correct time to maximise the fitness of an individual …
Hard Negative Document
During the *night shift* … an increase in body temperature … However, the *night shift* … does not exhibit the same variations between individuals as natural temperature regulation might. Revealing a correlation, rather than a causality between high body temperatures during night shifts and the subjective experience of discomfort with day-time sleep.
